

MONEY MANAGEMENT >

Integrated solution for smart retailer

LOOKING FOR A BETTER CONTROL?

Balancing your store is a time-consuming task in your daily operations. It is also critical for money lost prevention.

SMS includes different types of balancing to adapt your needs. We have also added some useful tools to help you save time and money.

Different balancing types are used by North American retailers. SMS can be configured to match **Cashier**, **Cash insert** or **Lane balancing**. In the **Cashier balancing** type, the accounting responsibility follows the operator number. By linking all media to the cashier logon, each cashier can move from one lane to another with its own drawer, as often needed. In the **Cash insert balancing** type, the store has a limited amount of cash insert ; different cashiers use the same cash insert which moves from one lane to the other. In this case, the media are registered on the cash insert number. Finally, the **Lane balancing** keeps all responsibilities by lane. The same drawer is left on the same lane and all media are registered on the lane number. You can also set the balancing operation on a daily or weekly based period.
